A claimed enzymatic RNA mol. for the cleavage of apolipoprotein (a) (apo(a)) mRNA, specifically a hammerhead ribozyme, has binding arms complementary to the present sequence (nucleotide position 12974). The ribozyme blocks to some extent apo(a) expression, and can therefore be used to diagnose or treat conditions related to lipoprotein (a) levels, e.g. atherosclerosis, myocardial infarction, stroke, restenosis and heart transcription from human apo(a) cDNA clones. Labelled transcripts were synthesised in vitro to form 2 templates. The oligonucleotides and incubated. After a designated time the reactions were stopped, and RNA sepd. on sequencing polyacrylamide gels. The percentage of substrate cleaved was determined by autoradiographic quantification, and the most
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                       enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and harzpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatchia transplant sathma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic RNA mols. which cleave apo(a) mRNA - useful in diagnosis and treatment of conditions related to Lp(a) levels, e.g. atherosclerosis, myocardial infarction, and heart diseases.

The ribozyme blocks to some extent apo(a) expression, and can therefore be used to diagnose or treat conditions related to lipoprotein (a) levels, e.g. atherosclerosis, myocardial infarction, stroke, resenosis and heart disease. PCR was used to generate a substrate for T? RNA polymerase transcription from human apo(a) cDNA clones. Labelled transcripts were superated to form 2 templates. The olloquucleotides and labelled transcripts were annealed, RNaseH added and the mixts. incubated. After a designated time the reactions were stopped, and RNA septo. on Sequencing polypacrylamide gals. The percentage of substrate cleaved was determined by autoradiographic quantification, and the most accessible ribozyme target sites chosen

The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (i) at least 5 ribbse residues (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-O-methyl modification at position 4 of the ENA; (iii) at least ten 2'-O-methyl modification; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in an alloantigen of a donor. They can also be used for enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis Riboxyme therapy impacts on the expression of expression which accompany treatment with retinoids and dexamethasone. The present sequence is used in the exemplification of the
                                                                                                           Claim 10; Page 166; 307pp; English.
auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Specifically designed oligodeoxyribonucleotides form triplexes in single-
or double-strand DNA at homopurine-homopyrimidine targets. These
triplexes block in vitro DNA synthesis by all DNA polymerases studied,
including Sequenases. Tag, Vent, and Pol I. A similar phenomenon occurs
when DNA polymerases are supplemented with accessory replication
proteins, including SSB protein. Replication blockage is highly sequence-
specific and even one or two point substitutions within either the target
sequence or the oligonucleotide abolish the effect. Sequence-specific
blocking of DNA replication in vivo is facilitated by the methods and
compositions of the present invention. The present sequence is a triplex-
forming oligonucleotide which targets ORF-EC of human papilloma virus
(position 436-452 in HPV57 and 438-452 in HPV2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence specific inhibition of DNA synthesis - by triplex-forming oligo:nucleotide(s), for detection of oncogene mutation(s) and treatment of e.g. HSV, Hepatitis C and Papillomavirus infection.

AAT50138-T50359 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT50360-765045). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme are then binds to 5 nucleotides either side of this site. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density of lipoproteins (HDL), prolonging HDL half life, and therefore increasing the abnormal levels of CETP, specifically atherosclerosis, familial chances of diabetes, transplant, atherosclerosis, familial hypercholesterolaemia, peripheral vascular disease, dyslipidaemia, hypoalphalipoproteinaemia, vascular complications of diabetes, transplant, atherectomy and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density createnosis. By inhibiting CETP, the levels of HDL and low density of decrease in LDL levels, and a corresponding increase in HDL levels. The HDL levels of HH bibozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and cofect CETP mRNA. As the HH ribozymes corresponding increase in HDL levels of the CETP gene, they have low non-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

PCR primers AAV43307-08 were used to amplify nucleic acid ligands of ICP4, which were isolated using the SELEX (Systematic Evolution of Liganda by Exponential enrichment) procedure. ICP4 is the major transcriptional regulator of Herpes simplex virus (HSV) gene expression. The specification describes a method for the identification of nucleic acid ligands to an ICP4 protein family member (PRM), which uses the SELEX procedure. The method is used to yield a mixture of nucleic acids enriched for nucleic acid sequences with relatively higher affinity and specificity for binding ICP4 protein family member. The nucleic acid ligands identified are used in the treatment or prevention of diseases or medical conditions in humans, specifically those caused by herpes viruses. They may also be used in diagnostic procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identification of nucleic acid ligands to ICP4 protein family member comprises preparing candidate mixture of nucleic acids, contacting candidate mixture of nucleic acids with ICP4, partitioning increased affinity nucleic acids, and amplifying.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes nucleic acid molecules which modulate the structures, expression and/or stability of a mann encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the final-like tyrosine kinase 1 (flt.1), kinase insert domain containing receptor (KDR) and/or foctal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAAK5755 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                               Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KER; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.

The invention relates to a method for producing polynucleotides having a defined sequence using rolling templates that successively add nucleotides (nts) to a longer primer strand. The method comprises: (i) incubating, under annealing conditions, a primer and a template that has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 5; Page 38; 109pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                                                           AAV48709-886 represent antisense oligonucleotides directed against the ExbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in Significant reddution in ExbB-2 protein expression, while oligonucleotides AAV48792-886 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that that contain 8-30 nucleotides, which contain at most B nucleotides that consecutive nucleotides able to form three H-bonds each to four consecutive rucleotides able to form three H-bonds each to four consecutive cytosines, and the ratio between residues able to form two H-bonds each to three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines for p53, ErB-2, junb, junb, TGP-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The coligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                              Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive quanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapputically or to modulate growth of cells in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transcript tag sequence increased in pancreatic and colorectal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pancreatic cancer; colon cancer;

differentially expresent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can sample bused in a method for diagnosting colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                 use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.

the 3'-region not complementary to the primer, a 3'-region complementary to the 3'-red of primer and a non-reactive 3'-remninus, with the template being shorter than the primer (ii) reacting the primer with at least one of a template-dependent polymortectide polymerase to extend it by at least one in (complementary to the 5'-region of template) at its 3'-end, (iii) separating the template and the extended primer; and it its 3'-end, (iii) separating the template and the extended primer; and (iv) repeating the cycle of (i) (iii) as often as needed to synthesize the desired polymorlectide. The method is especially used to produce synthesis of RNA or DNA and is more efficient than chemical coupling processes. It has higher specificity and eliminates the need for deprotection. The products can be cloned directly. The method avoids problems of waste disposal and includes an inherent editing effect (failure sequences will not be extended further in subsequent rounds) so that purification of the end product is facilitated. Synthesis may take place on a vector, simplifying cloning and sequences with codon usage optimized for a particular host can be prepared

Species-specific detection of a Trichosporon genus microbe species and a new polynuclectide - used for the diagnosis and the treatment of Trichosporosis.

Disclosure; Page 44; 47pp; Japanese.

The present invention describes a method for the species-specific detection of a Trichosporon genus microbe which includes detecting a polynucleotide specific to the species of a Trichosporon genus microbe. Trichosporon polynucleotides can be used for the diagnosis and treatment of Trichosporonsis. The method can distinguish Trichosporosis species to species level rapidly in high precision. AAA2674 to AAA26849 represent polynucleotide sequences from various Trichosporon species, which are used in the exemplification of the present invention

New kit comprising amplification primers AL46, AL44, AL42, AR48, AR44 or AR42, bumpers BL42 or BR42, and detectors DL52 or DR48 useful for detecting Campylobacter jejuni or C. coli sodB gene.

Claim 1; Col 5-6; 13pp; English.

Campylobacter coli and C. jejuni are causative species of acute diarrhoeal disease in humans. The present invention relates to detection of these bacteria, in humans, by using nucleic acid primers in Strand Displacement Reactions (SDA). These primers are specific for the C. coli and C. jejuni superoxide dismutase (sodB) gene. The present sequence is one such primer, BR42. BR42 is a downstream bumper primer for C. jejuni and C. coli sodB. The primers may be used after culture as means for confirming the identity of the cultured organism, and with clinical samples from humans or animals, e.g. faecal material or with samples of contaminated food or water, for the detection and identification of C. ejuni or C. coli

                                                                                                                                                                                                                                                                                                      The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide uspolymorphism (SNE). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to
                                                                                                                                                                                      Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention is concerned with the elucidation of the gene cluster from Streptomyces globisporus which regulates enediyne C-1027 synthesis. Enediyne C-1027 is an antibiotic, consisting of an apoprotein and a non-peptidic chromophore, which causes damage to DNA. The primers AAA63353-A63451 were used to isolate the open reading frames which comprise the gene cluster. The sequences within the gene cluster can be used to produce the protein and to identify antagonists, both of which can be used in the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotide array, genotyping, single base extension reaction, SBE, PCR primer; polymorphic locus; single nucleotide polymorphism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated nucleic acid comprising a nucleic acid encoding any of C-1027 open reading frames (ORFs) -7 to 42, excluding ORF 9 (cagA), useful for the production of enediyne C-1027 antitumor antibiotics.

```
The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
               The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothioate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vaccine; cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; mimunostimulacory; tumour; viral infection; bacterial infection; fungal infection; cancer; asthms; infection; pactasitic infection; cancer; asthms; infectious disease; allergy; immune deficiency; phosphorothicate; ss.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contracting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the sreat ameliorating the effects of psoriasis, ichthyosis, pityriasis, brian, pilaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic misses of the inside of blood.

The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]) receptor, IGF binding protein [IGFBP] - 2 or IGFBB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 or pityriasis, ruba, plants, serborrhoea, Keloids, Keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovacular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hidney disease, hyperproliferation of the inside of blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] 2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammantion and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-15916) in the properties of promises, inhibiting susfail for ameliorating the effects of psoriasis, inhibitions, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the Skin, a hypernevacular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidhey disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for ameliorating the effects of antisense oligonucleotide, (for Insulan-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - 2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of section mediates a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                        Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keartosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplaia; kidney disease; neoblation of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an cantiforned protein [Gornal Factor [168]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

CC inhibiting or reducing growth factor mediated cell proliferation of or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the attisense oligonucleotides of the present invention (see AAF4151 and AAF45153-C F43161). The method is useful for ameliorating the effects of psoriasis, crichtyosis, pityriasis, ruba, pilaris, perborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, chain or skin, growth factor-mediated malignancies, other sclerolic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Ameliorating the effects of a disorder, e.g. psoriasis, by administering V (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 7; Page 44; 201pp; English

The present invention relates to a method for ameliorating the effects of antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] or IGFBP], which is capable of inhibiting or reducing protein [IGFBP] 2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153 oligonucleotides of the present invention (see AAF4151 and AAF45153 inchthyosis, pityriasis, ruba, pliaris, serborrhoea, Keloids, Keratosis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, Keloids, Keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignanches, other sclerotic vessels or any other hyperpresorialiferation of the inside of blood vessels or any other hyperplasia

Example 8; Page 63; 201pp; English.

inflammation.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [167]-1 receptor, IGF binding protein [1678]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to an envention (see AAF45151 and AAF45153- F45161). The method is useful for ameliorating the effects of psoriasis, nothyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood to essets or any other hyperplasia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor IIGF]—I receptor, IGF binding protein [IGFPB]—2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the artisense oligonucleotide which can be used to design the artisense oligonucleotide which can seek invention (see AAF45151 and AAF45153—10 oligonucleotide which can wates, benign growths, cancers of the skin, a neoplasias, scleroderma, wates, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, chain or skin, growth factor—mediated malignancies, other sclerotic disease, kidhey disease, hyperproliferation of the inside of blood costs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an article antisense oligomucleotide, (for Insulin-like Growth Pactor [167]-1 receptor, 1GF binding protein [16FB]-2 or 1GFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

Continuation and/or other disorders. The present sequence is an inflormation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide is useful for ameliorating the effects of psoriasis, of physis, pityriasis, ruba, pilaris, perborrhoea, keloids, keratosis, nephasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin discorder; Insulin-like Growth Factor I receptor; IGFP-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keatosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neoblation of the retina; ss.
Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticarse alignancieride, (for Insulin-like Growth Factor [167]-1 receptor, 1GF binding protein [16FB]-2 or 1GFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be useful for ameliorating the effects of psoriasis, 154511. The method is useful for ameliorating the effects of psoriasis, cithiyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, the sease, kidney disease, hyperplasia
                                                                                                                                                                                                                                          Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 15 BP; 1 A; 5 C; 8 G; 1 T; 0 U; 0 Other;

The present invention relates to a method for ameliorating the effects of artisense oligonucleotide, (for Invalin-like Growth Factor [IGF] receptor, IGF binding protein [IGFSP] -2 or IGFRPB), which is capable inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the artisense oligonucleotides of the present invention (see AAF$151 and AAF$153 - P45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                       Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding procein, IGFBP-2; IGFBP3; inflammation, psoriasis; pilaris, growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis, neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasis, xidney disease; neoblasis, schoolition; hyperplasis, xidney disease;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliotrating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, Keloids, Keratosis, ineoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hidney disease, hyperproliferation of the inside of blood Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or Edmondson SR; Example 8; Page 63; 201pp; English. Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV'(ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

```
skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [167]-1 receptor, 1GF binding protein [168]-2 or 1GFBP3], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45133-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, planis, serborrhoea, keloids, keratosis, neoplasias, scleoder, warrs, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic vascals or any other hyperprioliferation of the inside of blood

Polymucleotides comprising one or more of twenty four novel single nucleotide polymorphisms in the TNRBF1B gene have been identified. TNRRSF1B regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function such as osteoporosis, metastatic bone disease, Paget's disease, rheumatoid arthritis and periodontal bone disease
akin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor. Ide binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense and oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, inchnyosis, pityriasis, ruba, pliaris, serbornhoea, keloids, keratosis, neoplasiss, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, baisin or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human Osteoclastogenesis Inhibitory Factor nucleotides, comprising single nucleotide polymorphisms, useful for studying e.g. osteoporosis, Paget's disease and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, TNFRSF11B; osteoclastogenesis inhibitory factor; single nucleotide polymorphism; SNP; osteoclast recruitment; osteoclast recruitment; osteoclast function; osteoporosis; metastatic bone disease; Paget's disease; rheumatoid arthritis; periodontal bone disease; ASO;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of the top strand of a double-stranded oligonucleotide probe corresponding to GRR of the FogRI gene. The probe was used in electrophoretic mobility shift assay of HepGZ cells that had been transfected with recombinant variants of the human interleukin 10 receptor alpha subunit (IL-10RA) and control. A single nucleotide in polymorphism has been discovered in the IL-10RA angle nucleotide in polymorphism has been discovered in the IL-10RA angle nucleotide and Arg. The invention provides variant human IL-10RA polypeptides and nucleic acids encoding them. The variants have an amino acid substitution at position Gly31 and/or Seri59 or from position Leu62 of the standard in-10RA sequence (see AAB82983). They display at least 3-fold modified, are useful in preparing antibodies, agonists and antagonists useful for diagnosing or treating various IL-10 or receptor-related medical conditions, e.g. cronn's disease, inflammatory bowel disease, ulcerative collits, autoimmune conditions such as systemic lupus erythematosus and rheumatoid arthritis, septic and toxic shock, and infection
                                                                  .

These organisms are the cause of authoreal disease in humans, and their rapid identification enables the appropriate treatment to be determined. The probes and primers can be used to identify the organisms in cultured samples, clinical samples such as faecal material and food and water
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel oligonucleotide primers for amplification and detection of superoxide dismutase target sequences found in Campylobacter jejuni and Campylobacter coli.

The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha; see AAF5718 for the reference sequence). Polymucleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression of a particular IL4Ralpha protein isoform, an expression destrable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRMA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha
                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide useful for the identification of therapeutics in allergic diseases is new.

08-FEB-2001

The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotronin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing recombinant organism that can be used to express SLC6A4 for protein Claim 12; Page 21; 152pp; English.

                                                                                                                                                                          The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serocutin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Solute carrier family 6 neurotransmiter transporter; sectonin 4; SLC6A4; genotyping; allele specific oligonuclectide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 gene for identifying drugs for treating disorders related to expression of the protein.
                                                          New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member agene for identifying drugs for treating disorders related to expression of the protein.

Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.

Claim 84; Page 157; 162pp; English

The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Protein Isoforms (APIS) in cerebrospinal fluid, serum or plasma. The abundance of the AFS and APIS is then normalised to an Expression Reference Protein Isoform (BRP1) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFS and APIS correlates with the severity of Alzheimer's Disease. The present sequence is a probe that may be used for screening an API

Novel genetic variants of G-protein coupled receptor gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. cancer.

Claim 16; Page 13; 75pp; English.

The invention relates to genetic variants of human G-protein coupled receptor 31 (GPR31) gene. The invention also relates to compositions and methods for hablotyping and/or genotyping the GPR31 gene in an elabolityping and/or genotyping the GPR31 gene in an individual. Polymuoleotides of the invention are useful in studying the expression and function of GPR31, and in expressing GPR31 protein for use constraints and an studying the effect of GPR31, and in expressing GPR31 protein for use and in studying the effect of the variation on the biological activity of GPR31 as well as on the binding affinity of candidate drugs targetting companies to the haplotyping method is useful for improving the efficiency and contained in gene associated with GPR31 activity e.g. cancer. This can also be used by the pharmaceutical research scientist to validate companies associated with GPR31 gene in an individual, which can also be used by the pharmaceutical research scientist to validate condicate drugs, for treating a specific condition drugs or disease condidate drugs, for treating a specific condition drugs or disease condition and also be associated with GPR31 activity. The present sequence is an allele specific oligonucleotide (ASO) probe used to detect human GPR31 gene polymorphisms

```
from a cell culture. The method comprises switching cells from a cell culture. The method comprises switching cells from a replicative to a productive or pseudo-sensecent state in one or more cells in the cell culture by transforming cells with a vector expressing a cell cycle inhibitor. The cells can then be maintained in culture for thomer periods of time, allowing protein fraction to be collected from the cell culture. The method is particularly useful for allowing controlled protein biosynthetic productivity of cell lines for commercial and research purposes. This sequence represents a tetracycline operator sequence that can be incorporated into the tetracycline regulated retroviral vectors described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Increasing the yield of a protein from a cell culture, particularly useful for controlled protein biosynthesis of cell lines for commercial or research purposes, comprises causing a pseudo-senescent state in the cell(s) of the culture.
                                                                                                                                       Tetracycline regulated retroviral vector related tetracycline operator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a method of increasing the yield of a protein

```
The present invention relates to a new polymucleotide comprising a nucleotide sequence which is a polymorphic variant of a reference sequence which is a polymorphic variant of a reference sequence for lecithin-cholsesterol acyltransferase (LCAT). The invention is useful for identifying an association between a trait (preferably a clinical response to drug targeting LCAT) and at least one genotype or haplotype of LCAT gene. The method of the invention has applicability in developing diagnostic tests and therapeutic treatments for Norum disease, fish-eye disease and atherosclerotic cardiovascular disease. The haplotyping methods are useful for studying population diversity, anthropological lineage, the significance of diversity and lineage at the phenotypic level, parentity testing, forensic applications and since the phenotypic level, parentity testing, forensic applications and close sociation between the LCAT genetic variation and a trait such as level of drug response or susceptibility to disease. In addition, the methods for identifying the LCAT haplotypes present in individuals are useful in the development of drugs targeting LCAT haplotypes in a population with a specific disease, e.g. Norum disease, will facilitate the development of drugs targeting the LCAT isoform(s) that are most crequent in that disease, population. The present uncleic acid sequence represents one of a collection (ABEC)+922-ABEC)+519 of allele-specific oligonucleotide (ASO) primers that were used in the invention to detect polymorphisms in the human LCAT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, protease inhibitor, PI4; kallistatin, therapy, polymorphic site, PS; haplotyping, genotyping, acute pancreatitis, drug screening; antiinflammatory, chromosome 14q31-q32.1; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to genotyping protease inhibitor (PI) 4

(kallistatin) gene of an individual, involves determining for the two
copies of the PI4 gene present in the individual, the identity of the
copies of the PI4 gene present in the individual, the identity of the
cucleotide pair at one or more polymorphic sites. PI4 gene is located on
chromosome 14931-922.1 Genotyping is useful for determining if an
chromosome 14931-922.1 Genotyping is useful for determining if an
chromosome 14931-922.1 Genotyping is useful for determining if an
chromosome 14931-922.1 Genotyping is useful for determining if an
completion. Haplotyping is useful for improving the efficacy and
conference at several steps in the discovery and development of drugs
conference that as a candidate agent for treating a
specific condition or disease predicted to be associated with
conference of clinical trials of candidate drugs for
treating a specific condition or disease predicted to be associated with
function of PI4, and in expressing PI4 protein for use in screening for
candidate drugs to treat diseases enlated to PI4 activity. The present
candidate drugs to treat diseases enlated to PI4 activity. The present
candidate drugs to treat diseases enlated to PI4 activity. The present
candidate drugs to treat diseases enlated to PI4 activity. The present
candidate drugs to treat diseases related to PI4 activity. The present
candidate drugs to treat diseases that activity. The present
candidate drugs to treat diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                    Genotyping protease inhibitor 4 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= a

The present invention describes an isolated human period (Drosophila)

homologue 1, (PERI) polymucleotide (I) comprising a sequence which is a

polymorphic variant for a reference sequence (ABL52077) for the PERI gene

or its fragment, or a polymorphic variant of a reference sequence

(ABL52078) for a PERI cDNA or its fragment. The present invention also

describes methods for genotyping and haplotyping the PERI gene of an

individual. (I) is useful in studying the expression and function of

PERI, and in expressing PERI protein for use in screening for candidate

cherapeutic purposes. A recombinant non-human organism transformed or

transfected with (I) can be used for studying expression of the PERI

isogenes in vivo, for in vivo screening and testing of drugs targeted

against PERI protein, and for testing the efficacy of therapeutic agents

and compounds for disorders associated with circadian rhythm regulation.

The present sequence represents an allele specific oligonucleotide primer

for human PERI, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó

The present invention describes an isolated human period (Drosophila) homologue 1, (PER1) polymucleotide (I) comprising a sequence which is a polymorphic variant for a reference sequence (ABL52077) for the PER1 gene or its fragment, or a polymorphic variant of a reference sequence or its fragment, or a polymorphic variant of a reference sequence (ABL52078) for the PER1 gene of an individual. (I) is useful in studying the expression and function of PER1, and in expressing PER1 protein for use in screening for candidate drugs to treat diseases related to PER1 activity. (I) is useful for transfected with (I) can be used for studying expression of the PER1 isogenes in vivo, for in vivo screening and testing of drugs targeted against PER1 protein, and for testing the efficacy of therapeutic agents and compounds for disorders associated with circadian rhythm regulation. The present sequence represents an allele specific oligonucleotide primer for human PER1, which is used in the exemplification of the present
                                                                                                                                                                               Novel isolated human period Drosophila homolog 1 polymucleotide, useful for therapeutic purposes, for studying the expression and function of the polymucleotide, and for expressing the homolog.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Solute carrier family 1; SLC1A4; haplotyping; human; cancer; primer; glutamate/neutral amino acid transporter; neurological disease; PCR; ss; amino acid transporter disorder; single nucleotide polymorphism; SNP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Solute Carrier Family 1 (SLC1A4) allele-specific oligonucleotide #62

```
The invention relates to an isolated polymucleotide (I) comprising a first nucleotide sequence which comprises solute carrier family 1 (II) and an isolated polypeptide (III) comprising an amino acid sequence (CI) and an isolated polypeptide (III) comprising an amino acid sequence (VI) and an isolated polypeptide (III) comprising an amino acid sequence which is a polymorphic variant of a reference sequence for SLCIA4 gene of an individual; (2) predicting a haplotype pair for SLCIA4 gene of an individual; (2) predicting a haplotype pair for SLCIA4 gene of an individual; (2) predicting a haplotype pair for SLCIA4 gene of an individual; (3) identifying an association between a trait and at least one haplotype or haplotype pair of SLCIA4 gene. (III) Is useful in screening for drugs targeting (III) that are useful for treating cancer, neurological diseases and amino acid transporter discorders. The methods are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating covered by the pharmaceutical research scientist to validate SLCIA4 as a condition or disease predicted condidate target for treating a specific condition or disease predicted condidate target for treating a specific condition of disease sesociated with SLCIA4 activity, e.g. cancer, neurological diseases conditions are also useful for screening compounds targeting SLCIA4. Anti-SLCIA4 antibody is useful in diagnostic, prognesic and therapeutic methods. ABK95761-ABK95807 represent SLCIA4 and related PCR primers used to identify single nucleotide polymorphisms condition of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                      The invention relates to a novel isolated polynucleotide comprising a small inducible cytokine subfamily A (cys-cys), member 24 (SCYA24) isogene. The polypeptide of the invention has antiasthmatic activity. The polynucleotide may have a use in gene therapy. The polynucleotide and polynucleotide are useful in the the development of drugs for treating diseases associated with SCYA24 activity, e.g. respiratory inflammatory diseases such as asthma. Allele-specific oligonucleotide (ASO) primers used for detecting polymorphisms in the SCYA24 gene are represented in ABLS7616-ABLS7645
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metaatasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; pladue neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
           New genetic variants of small inducible cytokine subfamily A member 24 gene, useful in studying expression and function of the protein, and for screening drugs to treat diseases such as asthma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                                                                                             8
```

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is

Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.

Claim 2; Page 35; 276pp; English.

```
The invention relates to single nucleotide polymorphisms in the gene encoding human intercellular adhesion molecule 2 (ICAM2). A method for haploryping the ICAM2 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ICAM2 haplotypes given the specification or whether both copies are defined by a haplotype or in the specification or whether both copies are defined by a haplotype or pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair of the ICAM2 gene can be trait and a haplotype or haplotype pair of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair. ICAM2 and its corresponding DNA are used for studying the expression and function of ICAM2, for use in screening
                                                                                                                                                                                                                                                                            ö
              tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polymucleotide containing polymorphisms in intercellular adhesion molecule 2 gene, useful in developing drugs for treating human immunodeficiency virus infection and inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, intercellular adhesion molecule 2; ICAM2; haplotyping; ss; haplotype pair; single nucleotide polymorphism; genotyping; PCR primer; gene therapy; drug screening; anti-HIV; anti-inflammatory; probe; human immunodeficiency virus; sequencing primer.

The invention relates to a method of genotyping bovine for improved milk production traits which comprises determining the diacylglycerol acyltransferase (DGATI) genotypic state of the bovine, wherein the DGATI gene and polymorphisms have been found to be associated with such improved milk production traits. The method is useful for selecting a bovine having a desired DGATI genotypic state. It is also useful for the identification and selection of a bovine having one of the polymorphisms in its DGATI gene from selected bovine which is useful for making a dairy product provides a beneficial health effect. An antibody to the protein having DGATI activity is useful for inhibiting the activity of bovine DGATI in a lactating bovine so as to modulate milk
                                                                                                                                                                                                            ó
for candidate drugs to treat diseases related to ICAM2 activity, such as HIV infection and inflammatory diseases. The sequences are also useful for studying the effect of variation on the biological activity of ICAM2 as well as on the binding affinity of candidate drugs targeting ICAM2. Sequences AAS05362-AAS05417 and AAS05419-AAS0542 represent allelespecific oligonucleotide probes, sequencing primers, PCR primers and CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Determining genetic merit of a bovine with respect to milk composition and volume for improved milk production, comprises determining the diacylglycerol acyltransferase gene genotypic state of the bovine.

The invention comprises the amino acid and coding sequence of the human Nacetylgalactosaminidase (NAGA) alpha protein. The invention specifically comprises novel polymorphic sites identified within the NAGA gene. The NAGA gene is located on chromosome 22q13.2-q13.31, and encodes a lysosomal glycohydrolase that cleaves alpha-Nacetylgalactosaminyl moieties in glycoconjugates. The NAGA DNA and protein sequences of the invention are useful for studying the expression and function of NAGA and for screening candidate drugs to treat diseases related to NAGA activity. The NAGA gene polymorphisms identified in the present invention are useful for haplotyping and genotyping the NAGA gene of an individual. The present DNA sequence represents an N-acetylgalactosaminidase gene allele-
                                                                                                                                                                                                                                             ö
production and/or milk solids content. DGAT1 nucleic acid and its fragments are useful in the farming industry. They are also useful to generate transgenic animals which are useful to investigate the molecular basis of DGAT1 action and to test a substance for the ability to prevent, slow or enhance DGAT1 activity. The present sequence is a PCR primer used for amplifying bowine DGAT1 gene polymorphic region. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New genetic variants of isolated N-acetylgalactosaminidase (NAGA), Alpha gene, useful for therapeutic purposes, for studying the expression and function of the polynucleotide, and for expressing NAGA protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; PCR; primer; 88; gene therapy; N-acetylgalactosaminidase alpha; chromosome 22q13.2-q13.31; lysosomal glycohydrolase; screening; SNP; NAGA-related disease; single nucleotide polymorphism; haplotyping; NAGA;

New haplotypes of human apolipoprotein C-IV gene, useful to diagnose and treat diseases associated with its activity such as hypertriglyceridemia.

Claim 16; Page 13; 64pp; English.

The invention relates to haplotyping the apolipoprotein C-IV (APOC4) gene of an individual, comprising determining if the individual has one of the APOC4 haplotypes or haplotype pairs fully defined in the specification. Haplotyping the APOC4 gene of an individual, comprises determining the identity of the nucleotide at two or more polymorphic sites in one copy of the gene. The method also comprises identifying an association between a trait and a haplotype or haplotype pair of the APOC4 gene, comprising comparing the frequency of the haplotype/pair in a population exhibiting the trait with that of a reference population. A higher frequency in the trait population indicates the trait is associated with the haplotype. The polymucleotides and screened compounds are useful for developing. The polymucleotides and screened compounds are useful for developing treatment for diseases associated with APOC4 activity such as hypertriglyceridaemia. AAS955807AAS95634 represent human apolipoprotein C-IV allele-specific oligonucleotides of the invention

Genotyping human natriuretic peptide receptor A/guanylate cyclase g an individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of the gene.

The invention relates to single nucleotide polymorphisms in the gene encoding the human natriuretic peptide receptor A/guanylate cyclase A cariomatriuretic peptide receptor A/guanylate cyclase A cariomatriuretic peptide receptor A, or NPRI polypeptide. A method for haplotyping the NPRI gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the NPRI haplotypes given in the specification or whether both copies are defined by a haplotype con in the specification or whether both copies are defined by a haplotype or haplotype pair of the haplotype or haplotype pair of the haplotype or haplotype pair or a population exhibiting the trait with the frequency of the haplotype or haplotype pair. NPRI and its corresponding DNA are used for studying the expression and function of NPRI, for use in screening for candidate drugs targeting NPRI. Sequences AAS99990. AAS99990. ARS99990. ARS99990

Koshy JY, Kliem SE,

New haplotypes of the human apolipoprotein A-IV gene, useful to diagnose and treat disorders associated with its abnormal expression or function such as coronary artery disease.

Claim 16; Page 15; 71pp; English.

The invention relates to haplotyping the human apolipoprotein A-IV habbah) game of an individual, comprising determining if the individual has one of the APOA4 haplotypes or haplotype pairs fully defined in the specification. Also disclosed are genotyping oligomuclectides (or alleft specific oligomuclectides, ASO) as well as methods for correlating a particular haplotype pair with a trait e.g. obesity, in a population. The APOA4 gene is located on chromosome lag33-qter. The methods of the invention are useful to diagnose and develop treatment for disorders associated with abnormal APOA4 expression or function, for example coronary heart disease and atherosclerosis. The APOA4 isogenes and screened compounds are useful for the treatment of disorders associated with abnormal APOA4 appression or function such as coronary artery disease. The present sequence is an APOA4 allede specific oligonuclectide, ASO, PCR primer used to detect an APOA4 polymorphism

Denton RR, Nandabalan K; Choi JY, Sentivegna SC, Chew A,

WPI; 2002-055250/07.

New polymorphic variants comprising interleukin-8 receptor beta (ILBRB) isogene, useful in expressing ILBRB protein for use in screening for candidate drugs to treat diseases related to ILBRB activity, e.g. inflammatory disorders.

Claim 16; Page 13; 74pp; English.

The invention relates to single nucleotide polymorphisms in the human interleukin 8 receptor beta (ILBRB) gene. A method for haplotyping the Library gene in an individual comprises identifying the nucleotide at one or library gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ILBRB haplotypes given in the operation or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. The large gene can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair of the ILBRB gene can be identified by comparing the frequency of the haplotype pair in a reference population, where a higher haplotype or haplotype pair. ILBRB and its corresponding DNA are used frequency in the trait population indicates the trait is associated with a reference population. ILBRB and its corresponding DNA are used for studying the expression and fleases related to ILBRB activity, such as the sequences are also useful for studying the effect of variation on the biological activity of ILBRB as well as on the binding affinity of candidate drugs to ILBRB as well as on the binding affinity of candidate drugs targeting ILBRB sequences Ass95579 represent allele-specific oligonucleotide probes, sequencing primers and PCR primers used to detect ILBRB gene polymorphisms

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABX32770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The persist or nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the aubstrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of context and the reaction of the ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, specially cincarferon alpha, beta or gamma or consensus interferon. The present sequence represents a RNA sequence of unknown function. Note: The present context and the specification. The complete sequence data but is not mentioned elsewhere in the sequence data but is not mentioned elsewhere in context and the complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at the sequence of sequence data for this patent was consensed the sequence data for this patent was sequence and sequence data for this patent was consensed the sequenc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to haplotyping the protocadherin 2 (PCDH2) gene, comprising determining which of the haplotypes given in the specification defines one or both copies of the individual's pCDH2 gene. The polymorphisms are within a 30.44 base pair sequence (ABA05413), fully defined in the specification. The polymorphic variants are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New protocadherin 2 (PCDH2) polymorphic variants and encoding genes, useful in expressing PCDH2 protein for screening candidate drugs to treat diseases related to PCDH2 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; PCDH2; protocadherin 2; haplotyping; polymorphic variant; SNP, single nucleotide polymorphism; cytostatic; cancer; chromosome 5q31; allele-specific oligonucleotide; ASO; PCR primer; ss.

protein for use in screening for candidate drugs to treat diseases such as cancer, related to PCDH2 activity, in studying the effect of the variation on the biological activity of PCDH2 and the binding affinity of candidate drugs targeting PCDH2. The haplotyping methods are useful in validating PCDH2 as a candidate target for treating a specific condition or disease predicted to be associated with PCDH2 activity or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with PCDH2 activity. The present sequence is that of a PCDH2 allele-specific oligonucleotide (ASO) PCR primer of
studying the expression and function of PCDH2, in expressing PCDH2
                                                                                                                                                                                                                                                                                                              the invention

Novel genetic variants of acid phosphatase 2, lysosomal polypeptide gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. Hodgkin's disease. Claim 17; Page 14; 109pp; English.

The invention comprises the human lysosomal acid phosphatase 2 (ACP2) nucleic acid and protein sequences. Specifically, the invention relates to the discovery of 22 novel polymorphic sites within the APC2 gene. The invention also comprises methods for haplotyping and genotyping the ACP2 gene in an individual. The ACP2 gene (located on chromosome 11) encodes a lysosomal-specific enzyme that caralyses the hydrolysis of orthophosphoric monoesters to alcohol and phosphate. The ACP2 gene and protein are pharmaceutically important in the treatment of Hodgkin's protein are pharmaceutically important in the treatment ACP2 gene and polymorphisms of the invention are useful in haplotyping the ACP2 gene. ACP2 haplotyping is useful in validating ACP2 as a target (and designing

```
disease and acid phospharase deficiency). The ACP2 gene polymorphisms are useful for ACP2 genetyping, which can also be used to develop diagnostic tests and therapeutic treatments. The ACP2 protein and mucleic acids of the invention are useful in the production of a transgenic animal which expresses ACP2 protein. The ACP2 nucleic acids of the invention are useful in the production of a transgenic animal which useful in the production of allele-specific oligonucleotides designed to genotype each of the ACP2 polymorphisms. Nucleic acids ABL36299-ABL36320 represent claimed ACP2 allele-specific probes. Nucleic acids ABL36321-acids ABL3644 represent claimed ACP2 allele-specific PCR primers. Nucleic acids ABL36321-acids ABL36364 represent claimed ACP2 allele-specific PCR primers. Nucleic

Novel cholinergic receptor, muscarinic 5 polynucleotide useful therapeutically and in screening for candidate drug to treat diseases related to the receptor activity.

Claim 14; Page 13; 72pp; English.

The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRM5) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its fragment. The invention is useful in drug screening assays. The molecules of the invention are useful in studying the expression and function of CHRM5, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the invention are useful in developing diagnostic tests and therapeutic treatments. The method is also useful in the design of clinical trials of candidate drugs for treating specific condition or disease associated with CHRM5 activity and is useful in determining whether an individual

```
has one of the haplotypes or one of the haplotype pairs. The invention is useful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genctyping and/or haplotyping the CHRMS gene in an individual. The present nucleic acid sequence trepresents one of a collection of allele-specific oligonucleotide (ASO) probes (ABR81765-ABK81774) that were used in the invention to detect polymorphisms in the human CHRMS gene

Pharmaceutical composition for treatment of anemia, thrombocytopenia and neutropenia comprises an immunostimulatory nucleic acid and a medicament for the respective disease.

Claim 18; Page 9; 27pp; English.

The invention discloses a pharmaceutical composition comprising an immunostimulatory nucleic acid and either an anaemia medicament. It thrombocytopenia medicament or a neutropenia medicament formulated in a carrier. The immunostimulatory nucleic acid can be selected from a methylated CpG nucleic acid, a T-rich nucleic acid, a poly-G nucleic acid and/or a nucleic acid having a phosphorothicate backbone. The and/or a nucleic acid having a phosphorothicate backbone in the compositions can be used for the treatment or prevention of anaemia, thrombocytopenia and neutropenia in a subject preparing to undergo chemotherapy, radiation treatment, and has received at least one dose of chemotherapy or radiation treatment. The treatment is required due to the effect of stress, including chemotherapy, on the formation of red blood cells, haematopoiesis. The composition provides a synergistic effect of the permits a lower dose of the medicament to be used, thus providing lower costs associated with using lower doses of the medicament, and reduced chances of inducing side effects. The efficacy of the combination

```
The invention relates to a method of prevention or treatment of gastric ulcer comprising administering a nucleic acid to a subject in need for treatment of gastric ulcer. A nucleic acid sample comprising oligonucleotide 2006 was administered to a mouse model by an oral route or a vehicle control. Colonisation of mice by Heliobacter pylori was assessed at time points from 1 day to 1 month after treatment. The ability of the nucleic acid to reduce H. pylori colonisation was assessed. The method is useful for preventing or treating a gastric ulcer on a subject e.g. human or non-human vertebrate animal including dog, rabbit, turkey, chicken, primate, rat and mouse. The method effectively treats or prevents gastric ulcers. The present sequence represents an immunostimulatory nucleic acid for the treatment of gastric ulcers
                                                                                                                                            ·.
is profoundly improved over the use of each of the medicaments alone. The sequences presented in AbX75990-ABX76123 are the immunostimulatory nucleic acids disclosed in the invention

Screening or diagnosing of Alzheimer's disease (AD) determine the stage or severity of AD in a subject, comprises analyzing a test sample of body fluid from the subject by 2-dimensional electrophoresis.

Disclosure, Page 93; 179pp; English

The present invention relates to methods for screening or diagnosing Alzheimer's disease (AD) to determine the stage or severity of AD in a subject, to identify subject at risk of developing AD, or to monitor the effect of therapy administered. The methods comprise analysing a test sample of body fluid by 2-dimensional electrophoresis to generate a 2-dimensional array of AD-associated features (AFs). The method alternatively comprises quantitatively detecting in a sample of body fluid from the subject, one or more AD-associated protein isoforms (APIs, ABRS9710-ABRS9184). The present sequence is a probe, used to illustrate the invention

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 63; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRM), where (I) is an inozyme, Zinzwe, G-Cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidurg resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gencitables are also useful for treating inflammatory disease such as cid molecules are also useful for treating inflammatory disease such as crimatic and molecules are also useful for treating inflammatory disease such as chemotherapy applications, ischnedisciption injury rejection, gene therapy applications, ischaemia/reperfusion injury

The invention describes a method of treating (T1) a subject having cancer involving administering an immunostimulatory nucleic acid (1) having conditions and a cancer medicament (M1) selected from conference describes and a cancer medicament (M1) selected from chemotherapeutic agent, immunotherapeutic agent, cancer vaccine or free of CpG and T-rich motifs. The composition is for the treatment of cancer (e.g. bone cancer, brain and CNS cancer, connective tissue cancer, ossophageal cancer, eye cancer, Hodgkin's lymphoma, larynx cancer, oral cavity cancer, skin cancer, and testicular cancer), and for preventing allergic responses in those receiving blood transfusions. It is also infections. The compination of the immunostimulatory nucleic acids and the cancer medicament is synergistic. The combination allows for the administration of lower, sub-therapeutic doses of either compound, but with higher efficacy than would otherwise be achieved using such low doses. The immunostimulatory nucleic acids function by enhancement of anti-body dependent cell cytocoxicity. This mechanism provides long lasting effects of nucleic acids, thus reducing dosing regimens, improving compliance and maintenance therapy, reducing emergency situations and improving quality of life. This sequence represents an immunostimulatory nucleic acid in the method of treating cancer described in the invention

New compositions comprising an immunostimulatory nucleic acid and an oil-in-water emulsion, useful for reducing viral shedding or tissue damage upon vaccination, or for inducing an immune response against infectious diseases

Claim 34; Page 34; 68pp; English.

The invention relates to a composition comprising an immunostimulatory nucleic acid (especially a CpG dinucleotide containing oligonucleotide) and an oil-in-water emulaion. Also included are reducing viral shedding in a non-human animal (by administering to a non-human animal infected with a virus or at risk of viral infection, an immunostimulatory nucleic acid and an oil-in-water emulaion), reducing tissue damage and poon or vaccination of a subject by administering to a subject by an invasive content issue damage arising from the adjuvanted vaccine, where the content is adjuvanted with an oil-in-water emulsion), inducing an immune vaccine; is adjuvanted with an oil-in-water emulsion in difference of vaccine; by administering to a subject an oil-in-water emulsion and a cpG oligonucleotide to produce the immune response) and reducing a dosage of antigen administered to a subject to produce an antigen specific immune response comprising administering to a subject an antigen in a subcomposition is useful for reducing viral shedding in a non-human animal infectious diseases, for reducing viral shedding in a non-human response.

Composition is useful for reducing viral shedding in a non-human composition with a virus or at risk of viral infection, for inducing an immune response to treat or prevent infectious diseases, for reducing a dosage of antigen contrain near or preventing cancer, or inducing an immune response to treat or preventing or preventing cancer, or inducing an immune cancer, oseophageal cancer, skin cancer, independence in antigen specific immune response concert, skin cancer, independence is an immune cancer, oral cavity cancer, skin cancer, nearly leading to AIDS) and fungal (e.g. candidasis) infections. The present sequence is an immunostimulatory oligonucleotide

                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human monoclonal antibody that binds to human CD30. The antibody is useful for treating or preventing tumour or autorimnume disease e.g. rheumatoid arthritis, systemic lupus erythematosus, systemic sclerosis, atopic dermatitis, Grave's disease, Hashimoto's thyroiditis, Wegner's granulomatosis, Omen's syndrome, chronic renal failure, acute infectious mononucleosis, harpes or HIV (human immunodeficiency virus) virus-associated diseases. The antibody is also useful for treating Hodgkin's disease, anaplastic large cell
                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; antibody; CD30; tumour; autoimmune disease; rheumatoid arthritis; systemic lupus erythematosus; systemic sclerosis; Grave's disease; ALCL; satopic dematitis; Hashimoto's thyroiditis; chronic renal failure; ALLD; acute infectious monouncleosis; angioimmunoblastic lymphadenopathy; HIV; Hodgkin's disease; Castleman's disease; Kaposi's sarcoma; lymphoma; ATL; adult T call lymphoma; human immunodeficiency virus; carcinoma; therapy; Wegner's granulomatosis; analpatic large cell lymphoma; charge; heavy chain variable domain; VH; complementarity determining region; CDR;

The method is useful for treating non-allergic inflammatory diseases. Such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunostimulatory, antiinflammatory, dermatological; antipsoriatic; antiulcer; gene therapy, vaccine; non-allergic inflammatory disease; psoriasis; eccema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss.

The invention relates to an improved primer discrimination method in allele-specific primer extension (ASPE). The invention also relates to primers useful in ASPE methods, which has in 3' portion an allelespecific nucleotide complementary to allelic variation nucleotide of target nucleic acid and an artificial mismatch nucleotide. The primers are useful for increasing discrimination between primers in ASPE. The ASPE method is useful in detecting a single point mutation as well as insertion and deletion variations. The present sequence is a probe/primer) used to detect variations in human HNP-1 alpha (hepatocyte nuclear factor-1) mutant exon 2. This sequence is used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel primer for use in allele-specific primer extension, has in 3' portion an allele-specific nucleotide complementary to allelic variation nucleotide of target nucleic acid and an artificial mismatch nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ds, allergy, asthma, poly-G nucleic acid; aerosol formulation; hypo-responsive subject; immunostimulatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides single-stranded (ss) DNA molecules that are generated intracellularly and are active in mediated triplex-dependent and/or recombinagenic chromosomal events within the cells and/or the cellular compartments. These oligonucleotides can be produced within the cells by providing a vector or plasmid which generates not only the oligonucleotides in the cells, but also a fusion protein which is both a reverse transcriptase and a restriction enzyme. The ssDNA may be produced directly, or initially as a stem-loop structure, which is then cleaved to yield ssDNA. The triplex forming oligonucleotide can be studying DNA repair, for generating of generating of studying DNA repair, for gene therapy, for generating new strains of transmited animals or plants, and in functional genomics. The present sequence is that of a PCR primer to ss triplex-forming oligonucleotide

CC sequence is that of a PCR primer to ss triplex-forming oligonucleotide

A334 (see ACF05805) or its reverse, and was used to detect ssDNA in mouse EL-10 cells following vector transfection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inducing a specific change in a target chromosomal nucleic acid molecule by introducing (into a cell) a nucleotide molecule encoding a reverse transcriptase or a RNA to be reverse transcribed into single stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to genotyping/haplotyping the cholinergic receptor, nicotinic, beta-polypeptide 2 (neuronal) (CHRNB2) gene of an individual,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genotyping cholinergic receptor, nicotinic, beta-polypeptide 2 gene of an individual involves determining for two copies of the gene, the identity of nucleotide pair at polymorphic sites selected from PS1-24.
                                                                                                                                                                                                           The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                 Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human CHRNB2 allele specific oligonucleotide (ASO) probe #13.

computative duetrimining to the two cupres of the individual, the identity of the nucleotide pair at one or more the individual, the identity of the nucleotide pair at one or more polymorphic sites selected from FS1-24. Also include are oligonuclectides for performing the method and the mucleotide sequence of the polymorphic variants of CHRNB2. The method is useful for detecting novel CHRNB2.

Co polymorphisms and for determining if an individual has a haplotype or polymorphisms and for determining if an individual has a haplotype or candidate agent for treating a specific condition or disease predicted to be associated with CHRNB2 activity (e.g. a memory disorder, Alzheimer's candidate agent for treating disorder, schizophrenia, attention of disease, epilepsy, (ADNFLE)), and in the design of clinical trials of frontal lobe epilepsy (ADNFLE), and in the design of clinical trials of candidate drugs for treating a specific conditions or disease predicted to be associated with CHRNB2 activity. The method is useful to screen for compounds targeting CHRNB2, the polymorphic mucleic acids are useful in brudying the expression and function of CHRNB2, and in expressing cranated to CHRNB2 activity. The polymorphic mucleic acids are useful in brudying the expression and function of CHRNB2, and in expressing cranated to CHRNB2 activity and are useful for therapeutic purposes. The CHRNB2 gene is located on chromosome 1021. The present sequence is an expensive and in expressing the invertible of the polymorphic ming the method of the invertible of the polymorphic ming the method of the polymorphic ming the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                g
                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modified oligo:nucleotide(s) conjugates to anthraquinone - useful as anti-sense agents for treating and diagnosing diseases.
                                       skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense of the present invention (see AAF45151 and AAF45153-64561). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasis, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood vessels or any other hyperplasia
                               The present invention relates to a method for ameliorating the effects of

The Ligase Chain Reaction has been improved to increase the "flexibility" or "dynamic range" of each probe set used in the detection of small mutations (single base deletions, insertions and changes, as well as multiple mutations where the size of the mutation is less than about 15$ of, the average probe length). Previously the determination of the genetic constituency of an individual has been time consuming. The invention comprises reacting probes and sample (suspected to contain the target nucleic acid) under hybridising conditions that have been modified - 1. the concentration of monovalent cation (Na+, K+, or NR3H+; R = H or lower alkyl) is 100-200mM; 2. a "hot start" (temp. range 50-95 degree C) may be
                                                                                                                                                                                                                                                                                                                                                                                                                         ·.
pseudonucleotides which contain anthraquinone. These oligomers were tested for stability in vitro and in vivo, and specificity of hybridisation to complementary DNA and RNA. Hybridisation was increased with respect to DNA and RNA complement in almost all cases. The oligomers which contain two anthraquinone modifications generally show cumulatively enhanced stability as compared to those with only one such residue. These oligomers are useful for therapeutic, esp. antisense therapy, diagnostic

Gaps

```
used, and 3. one of the downstream probes has a mismatch within 5 bases from the 5' end so it is not complementary to the target sequence (The complementary probe is also mismatched). These may be used either on their own or in conjunction. AAQ72439 and AAQ72440 are used to detect the G542X mutation in cystic fibrosis. The remaining probes are selected from AAQ7248, AAQ72441, AAQ72442 and AAQ7243. This invention is also correct P1 field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence shows an intron-exon boundary of the human haemopoietin receptor NR2 gene. Genomic libraries were screened to obtain genomic clones of the NR2 locus. These clones were characterised by mapping with partial endonuclease digestion, and specific probes were used to determine which fragments contained exon sequences. Intron/exon junction

Genomic libraries were screened to obtain genomic clones of the NR2 locus. These clones were characterised by mapping with partial endonuclease digestion, and specific probes were used to determine which fragments contained exon sequences. Intron/exon junction sequences (see AAT64459-86) were determined by sequencing across intron/exon boundaries and confirmed by PCN. NR2 (see also AAM14841) and genetic sequences encoding it (see also AAT64442) can be used in the
sequences (see AAT64459-86) were determined by sequencing across intron/exon boundaries and confirmed by PCR. MR2 (see also AAM4841) and genetic sequences encoding it (see also AAT6442) can be used in the development of (ant)agonists, therapeutics and diagnostic reagents based

The present invention describes an isolated nuclectide sequence (I) encoding at least a portion of the human alpha-7 neuronal nicotinic encoding at least a portion of the human alpha-7 neuronal nicotinic acetylcholine receptor (alpha7-hnAchR). Also described are: (I) a peptide encoded by (I), (2) a vector comprising (I); (3) a host cell transformed with a vector of (2); (4) a polymucleotide comprising at least 15 nucleotides which hybridises under stringent conditions to at least a portion of (I), (5) a method for detection of a polymucleotide encoding alpha 7-hnAchR. In a biological sample; and (6) a method for amplification of nucleic acid from a sample suspected of containing nucleic acid encoding alpha 7-hnAchR. The primers and probes from the present invention can be used on brain tissue and blood samples of humans suspected of suffering from schizophrenia, small cell lung carcinoma, breast cancer and nicotine-dependent illness. This is particularly useful cor diagnosis of schizophrenia, other illnesses that can be studied/diagnosed are epilepsy (e.g. juvenile myoclonic epilepsy) and prader-Willi and Angelman's syndromes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAVI1892-VI1900 are PCR primers used in the identification and isolation of a salt-inducible promoter (SIP) derived from the lactic acid bacterium Lactococcus lactis. Using the SIP, salt can be used as a food-grade inducer in food fermentation processes, e.g. in the production of cheese, dressings, water-containing spreads, sausages, or sour dough
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Salt-inducible promoter - derived from lactic acid bacteria, used for the production of polypeptides in food.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Salt-inducible promoter; lactic acid; food industry; food-grade inducer; fermentation processes; cheese production; PCR primer; ss.
development of (ant)agonists, therapeutics and diagnostic reagents based on ligand interaction with the receptor
                                                                                                                                                          Gaps

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a cibozyme (I) which cleaves RNA encoding a cytokine involved in the lammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, anticladeborrheic, antidiabetic, antidiabetic, and cophhalmological, cytostatic, antiseborrheic, antidiabetic, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, concerningment of squamous or basal cell carchinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing concerning such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AMB6209 represent sequences used in the cemplification of the present invention
                                                                                                                                                                                     Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KRAB domain, hyperplasia, thyroid, tumor, zinc finger motif; primer; cytostatic, antithyroid; gene therapy; chromosome 19; 19q13; ss.

```
The invention relates to a novel isolated molecule comprising bases 2-8 or 13-16 of 2 16 base pair sequences, or comprising a 1731 base pair sequence, all given in the specification or at 18-ast 95 % identity with the 1731 bp sequence. The mucleic acid molecule is useful in regulating apoptosis in cells and in drug screening. The method is useful in facilitating the induction of apoptosis in cells, in identifying an agent that can facilitate the induction of apoptosis in cells, and in inhibiting the growth of a cancer. This polymucleotide sequence represents a ribozyme binding substrate sequence relating to the
                                                                                                    This invention describes a novel nucleic acid (NI) encoding a polypeptide which comprises a KRAB-domain and/or at least one zinc finger motif. The products of the invention have cytostatic and antithyroid activity and can be used in gene therapy. Nucleic acids, polypeptides, and antibodies of the invention may be used in the diagnosis and/or the therapy of the malfunction of the thyroid and/or hyperlasais of the thyroid and/or thyroid and/or thyroid tumors. They may also be used in the production of medicaments. (NI) can also be used to diagnose thyroid tumors which are located on thromosome 19 at band 19413. This sequence represents a PCR primer used in the isolation of the thyroid malfunction-associated protein, RITA which is described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid molecule useful for regulating apoptosis induction in cells, for inhibiting the growth of cancer in subjects, and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel isolated molecule comprising bases 2-8 or 13-16 of 2 16 base pair sequences, or comprising a 1731 base pair sequence, all given in the specification or at least 95 % identity with the 1731 bp sequence. The nucleic acid molecule is useful in regulating apoptosis in cells and in drug screening. The method is useful in facilitating the induction of apoptosis in cells, in identifying an agent that can facilitate the induction of apoptosis in cells, and in inhibiting the growth of a cancer. This polynucleotide sequence represents a ribozyme binding substrate sequence relating to the

```
The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADB13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter. Spromber, a host cell comprising the promoter operably linked to a chereologous sequence, diagnosing or promoter operably linked to a chereologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism obtained from a cell or bodily fluid (comprising detecting a polymorphism of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing DNA, determining the presence or increased susceptibility to glaucoma or to a progressive ocular hypertenaive concerning in loss of visual field in a patient (or the severity or promoter resulting in loss of visual field in a patient (or the severity complification reaction primers that direct amplification of a selected mucleic acid region containing the variation within the optineurin containing the uncented mucleic acid region containing the variation within the optineurin promoter, and detecting the polymorphism). The invention is used to diagnose and progression or the progression or progression or the polymorphism) of present sequence is an optineurin promoter motif, repeat element or pursual progression or progression or the polymorphism or the invention is used to diagnose and progression promoter motif, repeat element or
New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 16 BP; 2 A; 6 C; 4 G; 4 T; 0 U; 0 Other;

The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter. Promoter operably linked to a single nucleotide polymorphism (SNP) in the optineurin of percentage as a single containing the promoter region of the optineurin gene, associated with a sample ontaining optineurin gene, associated with a glaucoma or the promoter response or increased sample containing by detecting the presence of an optineurin promoter sequence variation in a sample containing by determining the presence or increased succeptibility to glaucoma or to a progressive ocular hypertensive containing in loss of visual field in a patient (or the severity or promoter resulting in loss of visual field in a patient (or the severity amplification reaction primers that direct amplification of a selected conclaining the variation within the optineurin containing the promoter amplification containing the variation within the optineurin containing the promoter appropriate of detecting a polymorphism (comprising containing a sample containing the minimal promoter and amplifying the DNA) and detecting a polymorphism (comprising containing the primers promoter and amplifying the DNA) and optineurin promoter, and detecting a polymorphism of capable of detecting a SNP located within an optineurin promoter, and detecting a polymorphism of a sample containing a sample containing the minimal promoter and application of a source and amplifying the DNA) and optineuring a polymorphism of capable promoter and amplifying the DNA) and optineuring a polymorphism of a sample containing the minimal promoter and amplifying the DNA) and optineuring a polymorphism of capable of detecting a SNP located within an optineuring a polymorphism of a selected and applicated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        detecting the polymorphism). The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element or

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule possessing an NCH motifi), a G-cleaver (cleaving RNA with a NGM motif) pr an amberzyme (cleaving RNA with an NGM triple!), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2.+. Furthermore, it may be contexted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more contexted. The comprise the use of one or more the reatment may further comprise the use of one or more contexted (NHL), bulky low-grade or follicular NHL, lymphocytic treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular nucleic acid may be used to be used to more the nucleic acid may be used to be used to cleave RNA associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL) immunocytoma (IMC), small B-cell lymphomy the NOGO gene in the presence of a divalent cation that is preferably Mg^22+. Furthermore, the

The invention relates to a cyclic adenosine monophosphate (cAMP) phosphodiesterase type 7 (PDE7a3) splice variant. The polypeptide can be expressed by standard recombinant methodology. The PDE7a3 splice variant polypeptides and polymucleotides are useful for treating cardiovascular diseases, asthma, allery, inflammatory diseases, fertility disorders and immunoregulator disorders. The polymucleotides are useful for producing transgenic animals, which include knock-in animals (in which an animal
                                                                                                                                                                                                                                                                                                 ö
nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of the treatment may further comprise the use of one or more the reaction in particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzelener's disease, dementia, multiple sclerosis (MS), chemocherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creuzzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modellation of NOGO expression. The present sequence is an amberzyme molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptide of splice variant of cyclic adenosine monophosphate phosphodiesterase type 7 and polynucleotides, useful as vaccines for inducing immune response against diseases e.g. cardiovascular diseases

gene is replaced by human equivalent within the genome of the animal), useful in drug discovery process, for target validation. The PDE7a3 splice variant polypeptides and polymorlocuties are useful as vaccines for inducing an immunological response in a mammal. Sequences ABL58392-93 represent PCR primers used to verify the existence of the novel PDE7a3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated DNA molecule which encodes a polypeptide capable of binding to an intracellular domain of a p55 tumour necrotic factor (TNF) receptor. The DNA molecule is useful for preparing a composition for treating tumour, rhemmatoid arthritis or inflammatory diseases. The invention is useful in gene therapy. The present sequence is a PCR primer used in the construction of soluble dimeric TNF receptor
                                                                                                                                                                                                                                                                                                                                                                      Antisense PCR primer, EC55 to construct soluble dimeric TNF receptor.
                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New DNA molecule encoding a polypeptide capable of binding to an untracellular domain of a p55 tumor necrotic factor (TNF) receptor, useful for preparing a composition for treating tumor, rheumatoid arthritis or inflammatory diseases.

This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention. The method is for assessing cardiovascular status in humans by C determining the sequence of at least one polymorphic site in the ACE (angiotensin converting enzyme), AGT (angiotensin Dy ACT) (type I angiotensin II receptor) genes, and comparing the polymorphic pattern of with that in patients with predetermined markers of status. The method is used to assess blood pressure or electrocardiographic profile, to the intension, atherosclerosis or stroke. They can also be used to predict corporate to treatments with ACE inhibitors, angiotensin II receptor angonists, diuretics, alpha- or beta-adrenergic receptor antagonists, corporate to treatments with ACE inhibitors, angiotensin II receptor antagonists, corporate of nucleic acids containing polymorphic positions in the genes, and libraries of targets corresponding to the peptides from the genes are used to screen for cardiovascular agents. The nucleic acids the genes are used to screen for cardiovascular agents. The nucleic acids the genes are used to screen for cardiovascular agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACB), angiotensin II receptor type 1 (ATI) and type 2 (AT2), angiotensin II receptor type 1 (ATI) and type 2 (AT2), angiotensin II receptor type 1 (ATI) and type 2 (AT2), angiotensing in II receptor type 1 (ATI) and type 2 (AT2), angiotensing in II receptor type 1 (ATI) and type 2 (AT2), angiotensing the addressing the cardiovascular andothelin receptor type A and comparing the pattern of polymorphic positions within these genes, and comparing the pattern obtained from a population of individual with a reference polymorphic pattern obtained from a population of individual exhibiting a useful for determining the predisposition of an individual to cardiovascular disorders such as myocardial infarction, unstable angina, hypertension, atherosclerosis and stroke. They are also useful for predicting the likely cardiovascular disorders and across of cardiovascular disorders and across of they cardiovascular decreased and stroke. They are also useful for predicting the likely cardiovascular decreased to cardiovascular decreased and angioted to a partion of articular pattern treatment regimen. Act inhibitors, beta-adranezyic receptor antagonists (beta-blockers) or calcium channel blockers). Come or more polymorphic markers provides a basis for predicting the outcome of a treatment regimen. Fragments of the genes comprising apolymorphic site may be used as provides a past of detecting panetic polymorphic pattern reduces or inhibitors from clinical trials who are predicted to be noncentument from the streament regimen. Adverse results in an early trial can be evaluated to eliminate patients from clinical trials who are predicted to be noncentument regimen. Adverse results in an early trial can be evaluated to correlated with a sub-population of the terresponse, to a partioular patients from the treatment group. Beneficial drugs can be apu
                                                                                                 Angiotensin-converting enzyme gene, ACB; polymorphism; polymorphic marker; cardiovascular disease; myocardial infarction; unstable angina; hypertension; atherosclerosis; stroke; prognosis; drug screening; treatment outcome; human; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polymorphic pattern comprising polymorphic positions within genes encoding specific proteins, with reference polymorphic pattern.
                                                        Human angiotensin-converting enzyme (ACE) PCR primer, SEQ ID NO:9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assessing cardiovascular status in humans involves comparing test

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THe PCR primers shown in sequences AAC61201-C61371 were all used to demonstrate the

Transcriptional control recognition element recognition sequences may be recognised by control proteins and are involved in either enhancing or repressing transcription of associated sequences. TCR sequences include promoter elements, hormone receptor elements, viral, cellular, liver or tissue elements, etc. The sequence represents an exemplary tissue associated element, the immunoglobulin gene enhancer element mu E2. A typical application of the TCRE recognising oligonucleotides is inhibition of viral proliferation. See also AAQ30472-518. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligo-nucleotide(s) contg. transcription control recognition element - stabilised by covalent bonding of two DNA strands, act as decoys for regulatory protein to modulate specific RNA.
                                                                                                                                                                 The sequence is the complement of (250) (AAQ24927). The selected primer is used in practice of the single primer amplification reaction (SPAR). (Updated on 25-MAR-2003 to correct PN field.)
                                                         Nucleic acid sequence single primer amplification - useful for genomic variation analysis and polymorphism detection for restriction fragment length data.
                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transcriptional control recognition element, decoy, cellular RNA, promoter, hormone receptor element, viral; liver; tissue, viral; proliferation; linker, NF-1; ss.

The sequences given in AAQ92112-211 are probes which were used in the detection of a mutant p53 gene sequence. The DNA to be detected is amplified using PCR and then these probes which are pref. labeled using 12-P gamma-ATP are used to detect the mutant sequences. The primers and probes given in AAQ92096-213 are used in the method of the invention for detecting mammalian target DNA in sputum samples. Analysis of the target DNA is used to diagnose benign or malignant neoplasms of the lung. It is also useful for screening people at high risk or for monitoring progress of treatment of lung neoplasms. The method is based on the discovery that mutant terget DNA associated with lung cancer is present at detectable levels in sputum. Cells shed into sputum from head and neck cancers may also be detected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting target nucleic acid in mammalian sputum - particularly for diagnosis of lung neoplasia involving mutation(s) in the K-ras oncogene
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer; polymerase chain reaction, amplify; mutant; K-ras; PCR; flanking region; amplification; probe; detection; sputum; diagnosis; benign; malignant; neoplasm; lung; lung cancer; head; neck; ss.

The adenosine residue at position 15 is attached to the 3' adenosine residue by two TEG molecules which are joined via a phosphate group. The diol-contg, linking group forms phosphodiester bonds with both adenosines. The resulting oligonucleotide is resistant to exonuclease degradation. See also AAQ21884-Q21917

Ancylostoma secreted protein ASP-1 primer GSP 2.

```
This invention describes the use of novel acidophilic and thermostable xylanase enzymes (XYL I and XYL II) from Actinomadura sp. FC7 which retain their activity under harsh industrial conditions (e.g. high temperature or wide pH ranges) and may be secreted by recombinant host cemperature or wide pH ranges) and may be secreted by recombinant host calls, to treat plant biomass Xylanases XYL I and XYL II are part of a large group of hemicellulase enzymes and function by cutting the beta-1,4 bonds within the xylosic chain of xylan (a polymer of D-xylose residues that is a major constituent of hemicellulose). This means that they may be used in the paper and pulp industry to improve the efficiency of the bleaching process by degrading the structure of the material. XYL I and XYL II may also be used to treat feed, by degrading a substrate with a high temperatures (e.g. 70 deg. C) and at low pis (e.g. 4.0), conditions which tend to denature most known xylanases. Enzymes that cartive in these conditions may be used in industrial processes that are cartied out at high temperature and low pit to speed up other, non-enzymatic reactions, minimising costs, energy requirements, and the facilitate chlorine bleaching of paper pulp which is carried out in hot, acidic conditions). Pretreatment with XYL I and XYL II, allows the bleaching agents to penetrate better, to remove lignin from the pulp and colouration from it of main semilar engents of the degents can be used to produce the same or a better regult. Also, degruty and be used to produce the same or a better regult. Also, certified the structure aids water drainage. NOTE: This patent is an equivalent to F19503640. (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New acidophilic and thermostable xylanase enzymes from Actinomadura sp. RC7 - useful for treating plant biomass, especially paper and wood pulp, to degrade hemicellulose and hydrolyse xylan.
                                                            Xylanase; acidophilic; thermostable; XXL I; XYL II; plant biomass; hemicellulase; beta-1,4 bond; xylosic chain; xylan; D-xylose; paper; pulp; chlorine bleaching; feed; beta-glucan; cellulose; lignin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match 0.5%; Score 11.2; DB 1; Length 16; Best Local Similarity 81.2%; Pred. PCR primer GSP 2 (AAT38471) is based on Ancylostoma secreted protein (ASP) genes (see also AAT38466-68), and is located internally to primer (SAP1 see also AAT38400). It was used with a S' poly(6) anchor primer (AAT38473) in a S'RACE PCR amplification of Ancylostoma canthum L3 larva cDNA. A second PCR using nested primers (see also AAT38472-73) yielded (AAT38465) coding for ASP-1 (AAW04321), a protein useful in hookworm vaccine, was identified

Ancylostoma caninum secreted protein - useful as antigen for hookworm

This sequence represents a probe for the precore region of hepatitis by virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (1) in the sample, and amplifying the crietavant part of a suitable HBV gene in the sample and amplifying the crietavant part of a suitable HBV gene in the sample with at least consultable primer pair; (b) hybridising (1) with a combination of at least composite and hybridise specifically to mutent target sequences chosen from the HBV RP pol gene region, HBV procore region, HBABy region and/or HBV composition that the sample from the composition specificating the hybridise formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal(s). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, specifically genotype, precore mutations, vaccine escape mutations and RT generalization; (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guancine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in
             Detection and/or genetic analysis of hepatitis B virus - specifically genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                An oligonuclectide is claimed which contains 2-200 residues of natural or synthetic nucleosides which are linked via a nucleotide bridging group.

At least 2 of the residues are nucleoside carba analogues (i.e. mucleosides in which the furance ring is replaced by a cyclopentane ring) having a defined generic formula given in the patent; and at least conclude these nucleosides are consecutive on at least one occasion. The oligonucleotides can be used in antisense therapy for treating infections and diseases, e.g. by blocking the expression of bloactive proteins at the level of nucleic acids (e.g. oncogenes). They can also be used as diagnostic agents for detecting viral infections or genetically determined diseases. They have a higher antisense activity in cellular experiments than that of oligonucleotide which contain natural conclusions of the carba analogues. Furthermore they have increased stability towards degradation by nucleases, and their pairing with complementary RNA is improved. The present sequence is a specific example of an oligonucleotide containing the carba analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Probe; hepatitis b virus; HBV detection; RT pol region; genetic analysis; preCore region; HBsAg region; genotype specific target; mutation detection; ss.

AAV49008-236 represent antisense oligonucleotides directed against the rb gene. Of these, only aligonucleotides AAV49008-52 resulted in effective gene. Of these, only aligonucleotides AAV49052-236 had little effect. The oligonucleotides exemplify the navigation of negative growth control by rb, while oligonucleotides cannot contain the specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that contain 8-30 nucleotides which contain at most 8 nucleotides that contain 8-30 nucleotides cach to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds each to faur consecutive cytosines; do not contain two sequences of three consecutive cytosines, and the ratio between three H-bonds to three consecutive cytosines, and the ratio between the H-bonds to three consecutive cytosines, and the ratio between the H-bonds to three consecutive cytosines, and the ratio between the H-bonds to three consecutive cytosines, and the ratio between the H-bonds to the two sequences of three consecutive cytosines, and the ratio between the H-bonds to the two sequences of oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErB-2, junB, junD, TGF-bera lor robers 2 to control proliferation of primary cate of the consecution of primary cate, liver or kidney cells, osteoclasts and/or keratinocytes). The oligonucleotides can also be used to analyse thoration of primary cate of cancer or (targeting TGF) for the immune system

Claim 23; Page 89; 177pp; English.

The present invention describes a method for preparing an antisense oligodeoxymucleotide (DDN) sequence for blocking translation of a specific protein isoform that can be expressed as number of different isoform. AAA05243 represent specifically claimed

```
phosphorothioate antisense ODNs for blocking translation of Tenascin-C using the method of the invention. The method is useful for preparing an obn sequence for blocking translation of a specific isoform of Tenascin-C protein. The method is also useful for blocking translation of a specific family of isoforms of a protein. The method can also be performed by producing a long antisense expression vector encoding a long antisense producing translation of a specific protein isoform. The ODNs and long antisense constructs are useful in designing models for studying cellular development and differentiation. The method permits as a result of alternative splicing. AAA05244 represent an oligonucleotide from the present invention, which is given in the sequence listing but not mentioned further within the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Novel nucleic acid used for genotyping, e.g. to predict rate of drug metabolism.

Disclosure; Page 13; 46pp; English.

This sequence represents a PCR primer used in the amplification of exons 5 and 6 of human phenol sulphortansferase 2 (STP2). The invention relates from sequences AAZ59305-Z693152 which are fragments of the STP2 gene. The fragments are from the 8 exons, the promoter region, 3' and 5' untranslated regions of the STP2 gene. Each of the sequences contains a newly identified STP2 gene single uncleotide polymorphism (SNP). STP2 is a phenol sulphortansferase. Substrates for STP2 include minoxidit, acetaminophen, and paranitrophenol. Several of the nucleotide changes indentified at the polymorphism sites, give rise to an amino acid change. Amino acid changes can be used as probes for detecting STP2 polymorphisms. The polymorphic probes are used in screening and genotyphing, i.e. to predict the rate of metabolism of STP2 substrates, potential drug-drug interactions and adverse side effects. They can also be used to detect diseases resulting

in the CD36 genes. AAA40606 to AAA40759, and AAB02515 to AAB02564, represent nucleotide and amino acid sequences respectively which are used in the exemplification of the present invention

```
The present invention describes isolated nucleic acid molecules (A) encoding mutant CD36 proteins (B). Parasites such as Plasmodium falciparum (the major cause of malaria) are unable to utilise the mutated proteins to gain entry to, and infect cells. The mutant CD36 proteins do not function correctly preventing parasites utilising them to infect cells. The mutant CD36 proteins do not function correctly preventing parasites utilising them to infect cells. The mutant CD36 proteins according to standard methodologies. They may be used in this way to prevent and treat parasitic infections that utilise the CD36 protein to infect cells, such as P. falciparum, the major cause to CD36 protein to infect cells, such as P. falciparum, the major cause of CD36 expression and activity or a patient's CD36 DNA may be screened to determine whether there are any mutations present that may confer resistance to parasitic infections. The proteins and mucleic acids may also be used to prevent, diagnose and treat diseases associated with defects in insulin action and/or facts diseases in insulin action and/or subjects possessing mutations
                                                                                                                                ;
                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, rat, CD36; SHR; spontaneous hypertensive rat; diagnosis; therapy; screening; polyworphism; variant; detection; mutant; blood; mutation; insulin; glucose metabolism; fatty acid metabolism; catecholamine; malaria; infection; parasite; antiparasitic; antidiabetic; primer; ss.

The invention relates to a retroviral vector construct which consists of a 5'-long terminal repeat (5'-LTR); a tRNA binding site; an origin of second strand DNA synthesis; a 3'-LTR and gag/pol sequences modified to contain two or more stop codons. The invention also relates to a gag/pol expression cassette, and an envexpression cassette. The retroviral construct has anticancer, antiviral and immunomodulatory activity. The retroviral constructs are used to produce recombinant retroviral particles for use in gene transfer, particularly gene therapy, e.g. to deliver heterologous sequences that encode cytotoxins, prodrug activators, replacement genes, antisense sequences or ribozymes, immune accessory molecules and viral immunogens, particularly for treatment or prevention of tumours, viral infections and

The present sequence is provided in a specification relating to a method interstitial lung disease. The method involves detecting an interleukin-l receptor antagonist (IL-IRN) (+2018) allele 2, a tumour necrosis alpha (TNF-A) (-308) allele 2, or an allele in linkage disequilibrium with either of these two alleles. The method may be used to determine whether a subject has or is predisposed to develop an interstitial pneumonia or a pulmonary fibrosis and other disorders such as rheumatoid arthritis, systemic lupus erythmatosis, Sjogren's syndrome, systemic sclerosis, dermatomyocitis. The method is also used for identifying molecules which can be used as therapeutics for treating interstitial lung disease

```
The present invention describes differentially expressed genes involved in angiogenesis (1), and the polypeptides that encode them. (1) have cardiovascular activity, and can be used in the modulation of the angiogenesis. The nucleic acids and polypeptides may be used in the prevention, diagnosis and treatment of diseases associated with the production of antibodies against them and in assays to identify in the production of antibodies against them and in assays to identify conditators of their expression and activity. The antibodies and activity and modulate angiogenesis. The antibodies may also be used as diagnostic conditators that may be prevented, diagnosed and/or treated by the above theory and the prevented, diagnosed and/or treated by the above consorted include, for example vascular tumours, proliferative tumours, proliferative tumours, or proliferative vitreoretinopathy, theumatoid arthritis, Crohn's disease, atherosolerosis, ovarian hyperstimulation, pestidatis, endometriosis associated with neovascularisation, restencias usbecquent to balloon angioplasty, scar tissue over production. peripheral vascular disease and Reynaud's phenomenon, aneurysms, arterial restences, thrombophlebitis, conditions, heart failure such as congestive heart failure, age-related macular degeneration and osteoprosis. AAM12255 to AAM22255 to AAM39322 conditions, heart failure such as congestive heart failure, include include used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Differentially expressed genes involved in angiogenesis, useful for treating e.g. vascular tumors, atherosclerosis and/or restenosis subsequent to balloon angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 16 BP; 3 A; 9 C; 2 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the coding sequence of human Creaml, which is a protein containing a repetitive 86 amino acid motif. The protein is a transcriptional control factor, and is a conjugate of retinoblastoma protein (Rb). The present sequence is the an intron-exon junction in the coding sequence of the invention
                                                                                           protein coding sequence exon 25/intron 25 junction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New retinoblastoma protein binding protein, its preparation and application.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.5%; Score 11.2; DB 1; Length 16;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAS56729-AAS56968 represent DNA encoding BRCA-1 regulators, ribozyme target recognition RNA sequences, DNA fragments encoding the RNA and primers used in the methods of the invention. Hybridisation of ribozymes to their targets results in cleavage of the RNA target. The ribozymes can be used to cleave regulators of the tumour suppressor BRCA-1, resulting in upregulation or downregulation of BRCA-1 in a cell. The mRNA targets include those encoding the BRCA-1 regulator BRI, inhibitor dominant negative 4 (ID4), breast basic conserved protein 1 (BBCI), CHIR2, AF6, BR2 and BR3. Regulation of BRCA-1 is useful for treating and diagnosing cancer and other proliferative disorders. The severity of an incidence of cancer can be lessened by regulating tumour proliferation through modulation of BRCA-1 expression. The sequences of the invention are useful in the development of anti-cancer drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                peptides that are the regulators of BRCA-1, useful for treating diagnosing the presence of neoplastic cells in biological

                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                  The invention relates to a gag/pol expression cassette comprising a promoter, a gag/pol gene (I) and a polyadenylation sequence in which the 5' end of (I) has been modified to contain codons that are degenerate for gag, or the 3' end of (I) has been deleted without affecting the biological activity of the encoded integrase. The expression cassette and similar cassettes that express env protein, are used to produce recombinant retroviral particles by homologous recombination. These particles are gene transfer vectors, particularly for gene therapy of tumours or viral infections, also to induce an immune response, to treat or prevent diseases, or to suppress graft rejection or immune/autoimmune responses. This sequence represents an oligonucleotide primer used in
                                                                                                                                         New gag/pol expression cassette, for preparing retroviral particles for gene therapy, comprises a promoter, a gag/pol gene, and a polyadenylation sequence, and cannot form a replication competent virus by homologous

                                                                                                                                                                                                                                                                                  The invention relates to a method of detecting a virus, particularly of Norwalk-like viruses, using as an indication the nucleic acids of both complementary base sequences corresponding to positions 4851-5450 in the base sequence of CDNA of the prototype of Norwalk-like virus genogroup II (GII). Detection of Norwalk-like virus (GII) is useful in diagnosis of viral food poisoning e.g. non-bacterial gastroenteritis, and for examining foods, particularly fish and shellfish, and infectivity of polluted water systems and other contemination sources like work clothes. This sequence represents a probe for Norwalk-like virus (GII) CDNA, used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates, (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction, (c) a signal corresponding to the marker is detected from the resultant plates containing the clones having said marker sequence, (d) the order of the markers is changed so that the same discrimination Nos. succeed to the markers is changed so that the same discrimination Nos succeed to the marker in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination nos may be multiwell and lateral directions; (f) the mixed clones are cultured and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
Detecting Norwalk-like virus (GII) with kits based on nucleic acids of both complementary base sequences of highly conserved domain in cDNA of its' prototype, useful in diagnosis of viral food poisoning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ·,

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates, (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is defected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to plates; (e) the clones in the multiwell plates of the specified discrimination Nos. succeed to the maximum in the specified discrimination Nos. are mixed respectively in each wells of longitudinal creation littless are mixed respectively in each wells of longitudinal resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45321 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for the name in the present invention
resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1936-35 NM, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22:1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

The present invention relates to proliferation potential proteins (P2P) and polynucleotides encoding such proteins. P2P cDNAs encode proteins with domains for hnRNP association and Rb1 binding. The interaction of P2P cDNA products and Rb1 serve to modulate cell proliferation and/or biological functions associated with tumour suppression by an RNA processing mechanism. Antisense oligonucleotides to P2P polynucleotides are used to repress the proliferative potential of a normal, abnormal or cancer cell. Sequences of the invention are also used for antisense gene therapy. The present DNA sequence is P2P antisense oligonucleotide used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a cell
